

## Sterile eye drop

There is a misconception of the majority of people about the existence of sterile eye drops and these drops are working to sterilize the eye and the majority of patients use them. The people differed in the description of the name of sterile eye drop some patients called choramphenicol eye drop as a drop for sterilization of the eye and others called dexamethasone eye drop as a drop for sterilization of the eye.

The reason behind this misconception that most of the eye drops written on it the word (sterile ) which mean free of germs, but the majority of patients understand this word incorrectly that this word mean that this drop used for sterilization of the eye So I proposed to raise the word(sterile) from all eye drops to prevent the confusion that gets because of the presence of the word, since all the drops are free from germs. And do not forget to mention that God created the eyes and create with cleaning and disinfection device works 24 hours which is the tear and the tear contains material works

to moisturize and clean and protect the eye from germs.
