## Chapter Six

## Confidence Intervals and Sample Size

## 1. Preface:

A survey by the Roper Organization found that $45 \%$ of the people who were offended by a television program would change the channel, while $15 \%$ would turn off their television sets. The survey further stated that the margin of error is 3 percentage points, and 4000 adults were interviewed. Several questions arise:

1. How do these estimates compare with the true population percentages?
2. What is meant by a margin of error of 3 percentage points?
3. Is the sample of 4000 large enough to represent the population of all adults who watch television in the United States?
$\square$ Inferential statistical techniques have various assumptions that must be met before valid conclusions can be obtained.
4. The samples must be randomly selected.
5. The sample size must be greater than or equal to 30 or less.
6. The population must be normally or approximately normally distributed based on sample size.

## 2. Confidence Intervals for the Mean When $\sigma$ is Known

2.1. A point estimate is a specific numerical value estimate of a parameter. The best point estimate of the population mean " $\mu$ " is the sample mean " $\bar{X}$ ".
Example: The president of university want to estimate the average age of the student ( $\mu$ ). He could select a random sample of 100 students and find the average age $(\bar{X})$ of these students, say, 22.3 years. From the sample mean, the president could infer that the average age of all the students is 22.3 years. So $\bar{X}$ is estimator for the population ( $\mu$ ).
A good estimator should satisfy the following criteria:

1. The estimator should be an unbiased estimator. That is, the expected value or the mean of the estimates obtained from samples of a given size is equal to the parameter being estimated.
2. The estimator should be consistent. For a consistent estimator, as sample size increases, the value of the estimator approaches the value of the parameter estimated.
3. The estimator should be a relatively efficient estimator. That is, of all the statistics that can be used to estimate a parameter, the relatively efficient estimator has the smallest variance
2.2. An interval estimate of a parameter is an interval or a range of values used to estimate the parameter. This estimate may or may not contain the value of the parameter being estimated.

- In an interval estimate, the parameter is specified as being between two values. For example, an interval estimate for the average age of all students might be $21.9 \leq \mu \leq 22.7$, or $22.3 \pm 0.4$ years.

### 2.3. Confidence Intervals

- A confidence interval is a specific interval estimate of a parameter determined by using data obtained from a sample and by using the specific confidence level of the estimate.
- The confidence level of an interval estimate of a parameter is the probability that the interval estimate will contain the parameter, assuming that a large number of samples are selected
 and that the estimation process on the same parameter is repeated.
- For instance, you may wish to be $95 \%$ confident that the interval contains the true population mean.

### 2.3. Confidence Intervals Formula

Formula for the Confidence Interval of the Mean for a Specific $\alpha$ When $\sigma$ is Known is:

$$
\bar{X}-Z_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right)<\mu<\bar{X}+Z_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right)
$$

- For a $90 \%$ confidence interval, $\mathrm{z}_{\mathrm{a} / 2}=1.65$; for a $95 \%$ confidence interval, $\mathrm{z}_{\mathrm{a} / 2}$ 1.96; and for a $99 \%$ confidence interval, $\mathrm{z}_{\mathrm{a} / 2}=2.58 . \sigma / 2$ is the standard error,
- The term $\boldsymbol{Z}_{\boldsymbol{\alpha} / 2}\left(\frac{\sigma}{\sqrt{n}}\right)$ is called the margin of error (also called the maximum error of the estimate). For a specific value, say, $\alpha=0.05,95 \%$ of the sample means will fall within this error value on either side of the population mean.
- The margin of error also called the maximum error of the estimate is the maximum likely difference between the point estimate of a parameter and the actual value of the parameter.

Assumptions for Finding a Confidence Interval for a Mean When $\sigma$ Is Known

1. The sample is a random sample.
2. Either $n 30$ or the population is normally distributed if $n 30$.

* Assumptions for Finding a Confidence Interval for a Mean When o Is Known

1. The sample is a random sample.
2. Either $n \geq 30$ or the population is normally distributed if $n<30$.

Example 1: A researcher wishes to estimate the number of days it takes an automobile dealer to sell a Chevrolet Aveo. A sample of 50 cars had a mean time on the dealer's lot of 54 days. Assume the population standard deviation to be 6.0 days. Find the best point estimate of the population mean and the $95 \%$ confidence interval of the population mean.

## Solution

The best point estimate of the mean is 54 days. For the $95 \%$ confidence interval use $z=1.96$ (from table E).

$$
\bar{X}-Z_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right)<\mu<\bar{X}+Z_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right)
$$

$54-1.96\left(\frac{6.0}{\sqrt{50}}\right)<\mu<54+1.96\left(\frac{6.0}{\sqrt{50}}\right)$

$$
54-1.70<\mu<54+1.70
$$

$52.3<\mu<55.7$ OR $54 \pm 1.70$

One can say with $95 \%$ confidence that the interval between 52.3 and 55.7 days does contain the population mean, based on a sample of 50 automobiles.

Example 2: A survey of 30 emergency room patients found that the average waiting time for treatment was 174.3 minutes. Assuming that the population standard deviation is 46.5 minutes, find the best point estimate of the population mean and the $99 \%$ confidence of the population mean.

## Solution

The best point estimate is 174.3 minutes. The $99 \%$ confidence is interval use $z=2.58$ (from table E).

$$
\begin{aligned}
& \bar{X}-Z_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right)<\mu<\bar{X}+Z_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right) \\
& 174.3-2.58\left(\frac{46.5}{\sqrt{30}}\right)<\mu<174.3+2.58\left(\frac{46.5}{\sqrt{30}}\right)
\end{aligned}
$$

One can say with $99 \%$
confidence that the mean
waiting time for emergency
room treatment is between
152.4 and 196.2 minutes.
$174.3-21.9<\mu<174.3+21.9$
$152.4<\mu<196.2$
Example 3: The following data represent a sample of the assets (in millions of dollars) of 30 credit unions in southwestern Pennsylvania. Find the $90 \%$ confidence interval of the mean.

| 12.23 | 16.56 | 4.39 |
| ---: | ---: | ---: |
| 2.89 | 1.24 | 2.17 |
| 13.19 | 9.16 | 1.42 |
| 73.25 | 1.91 | 14.64 |
| 11.59 | 6.69 | 1.06 |
| 8.74 | 3.17 | 18.13 |
| 7.92 | 4.78 | 16.85 |
| 40.22 | 2.42 | 21.58 |
| 5.01 | 1.47 | 12.24 |
| 2.27 | 12.77 | 2.76 |

## Solution

1. Find the mean and standard deviation $(\bar{X}=11.091, \sigma=14.405$.
2. Confident intervals $=0.9 ; \alpha=1-0.9=0.1 ; \alpha / 2=0.05$.
3. $\mathrm{Z}_{\alpha / 2}=1.68$ from table $\mathrm{E} . \quad \bar{X}-Z_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right)<\mu<\bar{X}+Z_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right)$
$11.091-1.65\left(\frac{14.405}{\sqrt{30}}\right)<\mu<11.091+1.65\left(\frac{14.405}{\sqrt{30}}\right)$
$11.091-4.339<\mu<11.091+4.339$
$6.752<\mu<15.430$

## 3. Sample Size

- Sample size depends on: the margin of error, the population standard deviation, and the degree of confidence.
- the margin of error formula is:

$$
\begin{aligned}
& E=Z_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right) \\
& \mathrm{n}=\left(\frac{\mathrm{Z}_{\alpha / 2} \cdot \sigma}{\mathrm{E}}\right)^{2}
\end{aligned}
$$

- where $E$ is the margin of error. If necessary, round the answer up to obtain a whole number. That is, if there is any fraction or decimal portion in the answer, use the next whole number for sample size $n$.

Example 4: A scientist wishes to estimate the average depth of a river. He wants to be $99 \%$ confident that the estimate is accurate within 2 feet. From a previous study, the standard deviation of the depths measured was 4.33 feet.

Solution $\alpha=1-0.99=0.01$; From table $E$

$$
Z_{\mathrm{a} / 2}=2.58 E=2 ; \quad \sigma=4.33
$$

$$
\begin{gathered}
n=\left(\frac{Z_{\alpha / 2} \cdot \sigma}{E}\right)^{2} \square n=\left(\frac{2.58 \times 4.33}{2}\right)^{2} \\
n=31.2 \square n=32
\end{gathered}
$$

## 4. Confidence Intervals for the Mean When $\sigma$ is Unknown

Most of the time, the value of " $\sigma$ " is not known, so it must be estimated by using " $S$ ", namely, the standard deviation of the sample. When $S$ is used, especially when the sample size is small, the Student $\boldsymbol{t}$ distribution, most often called the $t$ distribution is used instead of normal distribution (Z).

The $t$ distribution shares some characteristics of the normal distribution and differs from it in others.
Similarity: between $t$ and normal distributions:

1. It is bell-shaped.
2. It is symmetric about the mean.
3. The mean, median, and mode are equal to 0 and are located at the center of the distribution.
4. The curve never touches the $x$ axis.

The $t$ distribution differs from the standard normal distribution in the following:

1. The variance is greater than 1 .
2. The $t$ distribution is actually a family of curves based on the concept of degrees of freedom, which is related to sample size.
3. As the sample size increases, the $t$ distribution approaches the standard normal distribution.

* Formula for a Specific Confidence Interval for the Mean When $S$ is Unknown

$$
\bar{X}-\boldsymbol{t}_{\alpha / 2}\left(\frac{s}{\sqrt{n}}\right)<\boldsymbol{\mu}<\bar{X}+\boldsymbol{t}_{\alpha / 2}\left(\frac{s}{\sqrt{n}}\right)
$$

- The values for $t_{\mathrm{a} / 2}$ are found in Table F.
- Degree of freedom d.f. $=\mathrm{n}-1$

Example 5: Find the ta2 value for a $95 \%$ confidence interval when the sample size is 22 .

## Solution

The d.f. $=22-1=21$.
Find 21 in the left column and 95\% in the row labeled Confidence Intervals. The intersection where the two meet gives the value for $t_{\mathrm{a} / 2}$, which is 2.080 .

| Table F | The $t$ Distribution |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| d.f. | Confidence intervals | 80\% | 90\% | 95\% | 98\% | 99\% |
|  | One tail, $\alpha$ | 0.10 | 0.05 | 0.025 | 0.01 | 0.005 |
|  | Two tails, $\alpha$ | 0.20 | 0.10 | 0.05 | 0.02 | 0.01 |
| 1 |  | 3.078 | 6.314 | 12.706 | 31821 | 63.657 |

## $>$ Assumptions for Finding a Confidence Interval for a Mean When S is Unknown

1. The sample is a random sample.
2. Either $n \geq 30$ or the population is normally distributed if $n<30$

Example 6: Ten randomly selected people were asked how long they slept at night. The mean time was 7.1 hours, and the standard deviation was 0.78 hour. Find the $95 \%$ confidence interval of the mean time. Assume the variable is normally distributed.

## Solution

Since $\sigma$ is unknown and $S$ must replace it, the $t$ distribution (Table $F$ ) must be used for the confidence interval.

$$
\text { d.f. }=10-1=9 \square \text { The confidence interval }=95 \% \square t_{\mathrm{a} / 2}=2.262
$$

Substituting in the formula. $\bar{X}-\boldsymbol{t}_{\alpha / 2}\left(\frac{s}{\sqrt{n}}\right)<\boldsymbol{\mu}<\bar{X}+\boldsymbol{t}_{\alpha / 2}\left(\frac{s}{\sqrt{n}}\right)$

$$
7.1-2.262\left(\frac{0.78}{\sqrt{10}}\right)<\mu<7.1+2.262\left(\frac{0.78}{\sqrt{10}}\right) \square 6.54<\mu<7.66
$$

Therefore, $95 \%$ confident that the population mean is between 6.54 and 7.66 hr .
Example 7: The data represent a sample of the number of home fires started by candles for the past several years. (Data are from the National Fire Protection Association.) Find the $99 \%$ confidence interval for the mean number of home fires started by candles each year. $\begin{array}{llllllll}5460 & 5900 & 6090 & 6310 & 7160 & 8440 & 9930\end{array}$

## Solution

- Find the mean and standard deviation for the data. ( $\bar{X}=7041.4 \& S=1610.3$ )
- Confidence interval $=99 \%$; d.f. $=6$.

- Substitute in the formula and solve. $\bar{X}-t_{\alpha / 2}\left(\frac{s}{\sqrt{n}}\right)<\mu<\bar{X}+t_{\alpha / 2}\left(\frac{s}{\sqrt{n}}\right)$ $7041.4-3.707\left(\frac{1610.3}{\sqrt{7}}\right)<\mu<7041.4+3.707\left(\frac{1610.3}{\sqrt{7}}\right) 4785.2<\mu<9297.6$
- So, at $99 \%$ confident that the population mean number of home fires started by candles each year is between 4785.2 and 9297.6 .
OVERALL: As stated previously, when $\sigma$ is known, $Z_{\alpha / 2}$ values can be used no matter what the sample size is, as long as the variable is normally distributed or $n \geq 30$. When $\boldsymbol{\sigma}$ is unknown and $n \geq \mathbf{3 0}$, then $\boldsymbol{S}$ can be used in the formula and $\boldsymbol{t}_{\alpha / 2}$ values can be used. Finally, when $\sigma$ is unknown and $\boldsymbol{n}<\mathbf{3 0}$, $\boldsymbol{S}$ is used in the formula and $\boldsymbol{t}_{\alpha / 2}$ values are used, as long as the variable is

*|f $n<30$, the variable must be normally distributed. approximately normally distributed.

## 5. Confidence Intervals for Variances and Standard Deviations

- In statistics, the variance and standard deviation of a variable are as important as the mean. For example, when products that fit together (such as pipes) are manufactured, it is important to keep the variations of the diameters of the products as small as possible; otherwise, they will not fit together properly and will have to be scrapped. In the manufacture of medicines, the variance and standard deviation of the medication in the pills play an important role in making sure patients receive the proper dosage. For these reasons, confidence intervals for variances and standard deviations are necessary.
- To calculate these confidence intervals, a new statistical distribution is needed. It is called the chi-square distribution $\left(\chi^{2}\right)$.
- The chi-square variable is similar to the $\mathbf{t}$ variable in that its distribution is a family of curves based on the number of degrees of freedom.
- The chi-square distribution is obtained from the values of

It is normal distributed population

- A chi-square variable cannot be negative, and the distributions are skewed to the right. At about 100 degrees of freedom, the chi-square distribution becomes somewhat symmetric. The area under each chisquare distribution is equal to 1.00 .
- Table G gives the values for the chisquare distribution.

| Thile 6 | The ChiSquare Distribution |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Degrees of freedom | $\boldsymbol{\alpha}$ |  |  |  |  |  |  |  |  |  |
|  | 0.995 | 0.99 | 0.975 | 0.95 | 0.90 | 0.10 | 0.05 | 0.025 | 0.01 | 0.005 |
| 1 | - | - | 0.001 | 0.004 | 0.016 | 2.706 | 3.841 | 5.024 | 6.635 | 7.879 |

Example 8: Find the values for $\chi^{2}$ right and $\chi^{2}$ left for a $90 \%$ confidence interval when $n 25$.

## Solution:

To find $\chi^{2}$ right, $\alpha=1-0.90=0.10 ; \alpha / 2=0.05$.
To find $\chi^{2}$ left, $\alpha=1-0.95=0.05$.
d.f. $=n-1=25-1=24$

Hence, use the 0.95 and 0.05 columns and the row corresponding to d.f. $=24$.

- From table: $\chi^{2}=36.415$ at right; and $\chi^{2}=13.848$ at left

### 5.1. Confidence Interval for a Variance $\frac{(n-1) S^{2}}{\chi_{\text {right }}^{2}}<\sigma^{2}<\frac{(n-1) S^{2}}{\chi^{2}{ }_{\text {left }}}$ d. $n .=n-1$

### 5.2. Confidence Interval for a Standard Deviation <br> Assumptions: <br> $$
\sqrt{\frac{(n-1) S^{2}}{\chi_{r i g h t}^{2}}}<\sigma<\sqrt{\frac{(n-1) S^{2}}{\chi_{\text {left }}^{2}}}
$$ <br> 1. The sample is a random sample.

2. The population must be normally distributed

Example 9: Find the $95 \%$ confidence interval for the variance and standard deviation of the nicotine content of cigarettes manufactured if a sample of 20 cigarettes has a standard deviation of 1.6 milligrams.

## Solution

$$
\begin{aligned}
& \text { d.n. }=n-1=20-1=19 \\
& \alpha=1-0.95=0.05 \\
& \alpha / 2=0.05 / 2=0.025 \text { (right) } \\
& \chi_{\text {right }}^{2}=\chi_{0.025}^{2}=32.852 \\
& 1-\alpha / 2=0.975 \text { (left) } \\
& \chi_{\text {left }}^{2}=\chi_{0.975}^{2}=8.907
\end{aligned}
$$

$$
\begin{gathered}
\frac{(n-1) S^{2}}{\chi_{\text {right }}^{2}}<\sigma^{2}<\frac{(n-1) S^{2}}{\chi_{\text {left }}^{2}} \\
\frac{(20-1)(1.6)^{2}}{32.852}<\sigma^{2}<\frac{(20-1)(1.6)^{2}}{8.907} \\
1.5<\sigma^{2}<5.5
\end{gathered}
$$

$$
\begin{aligned}
& \sqrt{\frac{(n-1) S^{2}}{\chi_{r i g h t}^{2}}}<\sigma<\sqrt{\frac{(n-1) S^{2}}{\chi^{2} \text { left }}} \\
& \sqrt{\frac{(19)(1.6)^{2}}{32.852}}<\sigma<\sqrt{\frac{(19)(1.6)^{2}}{8.907}} \\
& 1.2<\sigma<2.3
\end{aligned}
$$

Example 10: Find the $90 \%$ confidence interval for the variance and standard deviation for the stability test of asphalt cores in kN. The data represent a selected sample from a specific mix designed for a road. Assume the variable is normally distributed. 59 $\begin{array}{llllll}54 & 53 & 52 & 51 & 39 & 49\end{array}$ 464948

## Solution:

- Determine the variance for the data; $S^{2}=28.2$.
- $1-\alpha=1-0.9=0.1 ; \alpha_{\text {left }}=0.05$,

$$
\alpha_{\text {right }}=0.9+0.05=0.95 ; \text { d.n. }=n-1=10-1=9
$$

- Find $\chi_{\text {left }}^{2}$ from Table $=3.325 ; \chi_{\text {right }}^{2}$ from Table $=16.919$

$$
\begin{gathered}
\frac{(\mathrm{n}-1) \mathrm{S}^{2}}{\chi_{\text {right }}^{2}}<\sigma^{2}<\frac{(\mathrm{n}-1) \mathrm{S}^{2}}{\chi_{\text {left }}^{2}} \\
\frac{(9)(28.2)}{16.919}<\sigma^{2}<\frac{(9)(28.2)}{3.325} \\
\sqrt{\frac{(n-1) S^{2}}{\chi_{\text {right }}^{2}}}<\sigma<\sqrt{\frac{(n-1) S^{2}}{\chi_{\text {left }}^{2}}} \square 3.87<\sigma<\mathbf{\sigma ^ { 2 }}<76.3
\end{gathered}
$$
