DOUBLE LINKED LIST (DLL)

- A double linked list is a two-way list in which all nodes will have two links. This helps in accessing both successor node and predecessor node from the given node position.

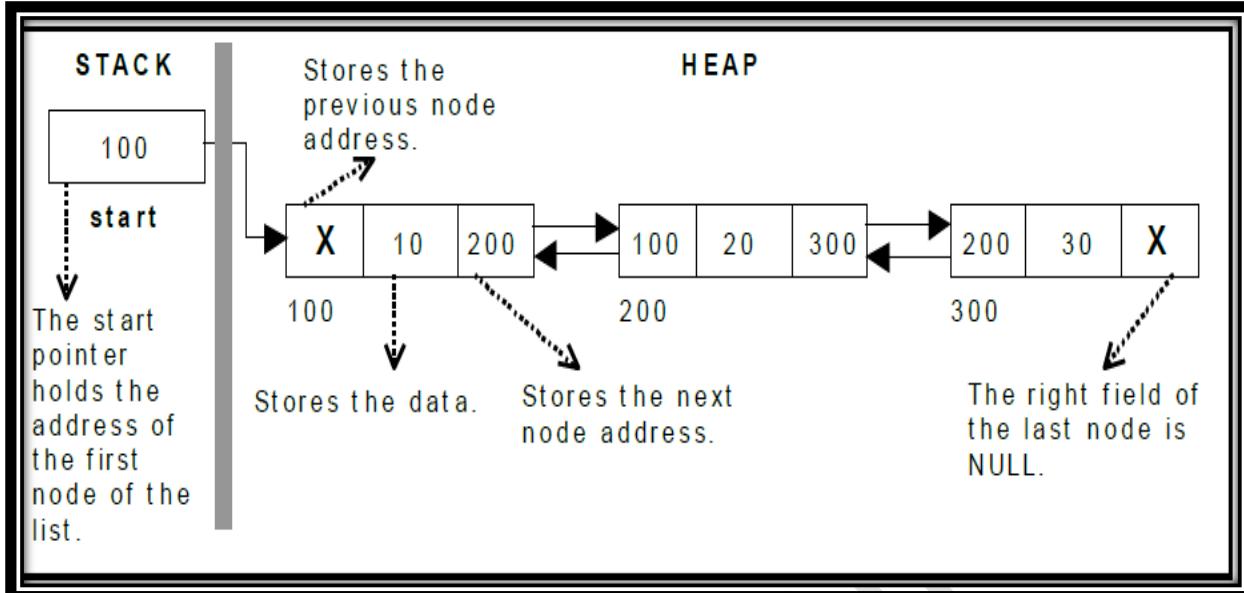

It provides bi-directional traversing. Each node contains three fields:

- Left link.
- Data.
- Right link.

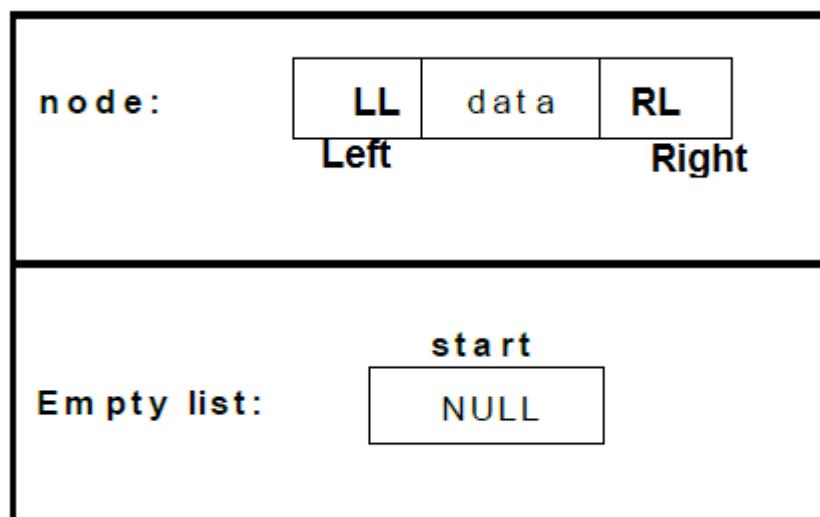

- The left link points to the predecessor node and the right link points to the successor node. The data field stores the required data.
- Many applications require searching forward and backward thru nodes of a list. For example searching for a name in a telephone directory would need forward and backward scanning thru a region of the whole list.
- The basic operations in a double linked list are:
 - Creation.
 - Insertion.
 - Deletion.
 - Traversing.

A double linked list is shown in below figure:

- The following code gives the structure definition

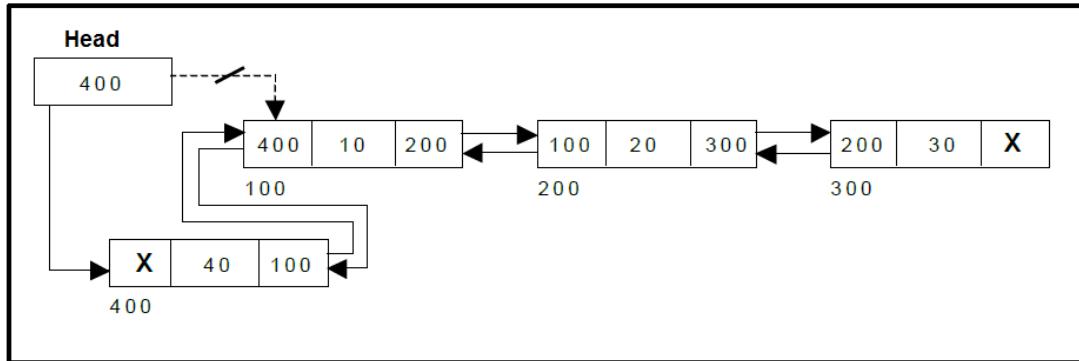

```
struct node
{
    int Data;
    node *LL,*RL;
};
node *head=NULL;
```

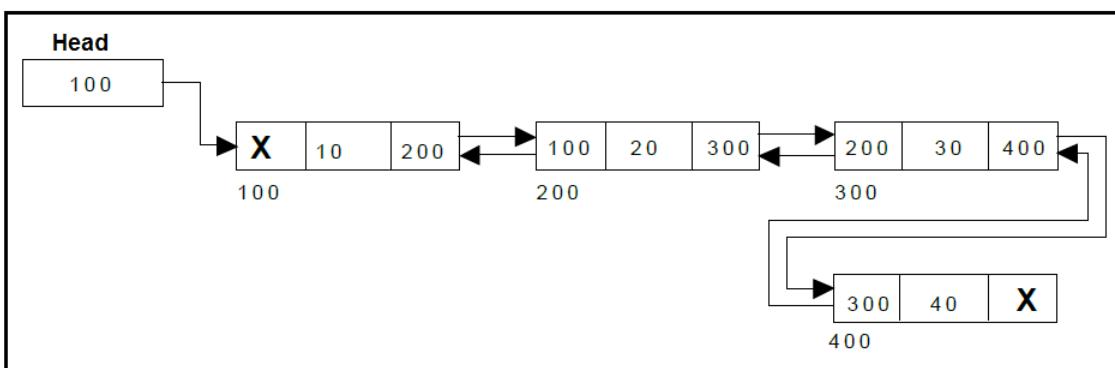

INSERT NODE AT FIRST OF DOUBLE LINKED LIST:

```
void insertF(int n)
{
    node *X=new node;
    X->Data=n;
    X->LL=NULL;

    if (head==NULL)
        X->RL=NULL;
    else
        {X->RL=head;
        head->LL=X;
        }
    head=X;
}
```

**INSERT NODE AT THE END OF DOUBLE LINKED LIST:**

```
void insertEnd(int n)
{
    node *X=new node;
    X->Data=n;
    X->RL=NULL;
    node *q=head;
    while (q->RL!=NULL)
        q=q->RL;
    q->RL=X;
    X->LL=q;
}
```

```
//////////
```

INSERT NODE AT THE MID OF DOUBLE LINKED LIST:

```
void insertMid(int n, int y)
{
    node *X=new node;
    X->Data=n;
    node *q=head;
    while (q->Data!=y)
        q=q->RL;
    X->RL=q->RL;
    q->RL->LL=X;
    q->RL=X;
    X->LL=q;
}
```
