In graph theory a cut is a partition of the vertices of a graph into two disjoint subsets. In a flow network, an $s-t$ cut is a cut that requires the source and the sink to be in different subsets, and its cut-set only consists of edges going from the source's side to the sink's side.

Definition: (Cuts in Networks) A cut of a network D , denoted by (S, T) or K , is the set of arcs (edges) $\{st: s \in S; t \in T\}$, whose removal disconnects the network into two components.

The capacity of a cut is sum of the weights of the edges beginning in S and ending in T .

Min-cut Max-Flow Theorem: For any network D , the value of the maximum flow is equal to the capacity of the minimum cut.

Example 1: Find max. flow in the following flow network and determine the corresponding min. cut.

$flow = 0$

Path 1: $s-2-3-t$
flow = 2

Path 2: $s-1-4-t$
flow = 2

Max. flow = 4

6

Cut = 5

Cut = 5

Cut = 11

Cut = 9

Cut = 5

Cut = 4

Cut = 6

Mim. Cut = 4 = Max. flow

Cut = 7

Cut = 6

Example 2: Find max. flow in the following flow network and determine the corresponding min. cut.

flow = 0

*Path 1: $s - 4 - 7 - t$
flow = 10*

*Path 2: $s - 2 - 5 - t$
flow = 9*

Path 3: $s - 3 - 6 - t$
flow = 5

Path 4: $s - 4 - 7 - 3 - 6 - t$
flow = 3

Path 5: $s - 2 - 6 - t$
flow = 1

Max. flow = $10 + 9 + 5 + 3 + 1 = 28$

Mim. Cut = 28 = Max. flow

Thank You
