Collector Feedback Configuration

Another way to improve the stability of a bias circuit is to add a feedback path from collector to base.

>In this bias circuit the Q-point is only slightly dependent on the transistor beta, β .

Base-Emitter Loop

V_{CC}

From Kirchhoff's voltage law:

$$\mathbf{V}_{\mathbf{C}\mathbf{C}} - \mathbf{I}_{\mathbf{C}}'\mathbf{R}_{\mathbf{C}} - \mathbf{I}_{\mathbf{B}}\mathbf{R}_{\mathbf{B}} - \mathbf{V}_{\mathbf{B}\mathbf{E}} - \mathbf{I}_{\mathbf{E}}\mathbf{R}_{\mathbf{E}} = \mathbf{0}$$

Since $I_B \ll I_C$:

$$\mathbf{I'}_{\mathbf{C}} = \mathbf{I}_{\mathbf{C}} + \mathbf{I}_{\mathbf{B}} \cong \mathbf{I}_{\mathbf{C}}$$

Knowing $I_C = \beta I_B$ and $I_E \cong I_C$, the loop equation becomes:

$$\mathbf{V}_{\mathbf{C}\mathbf{C}} - \beta \mathbf{I}_{\mathbf{B}}\mathbf{R}_{\mathbf{C}} - \mathbf{I}_{\mathbf{B}}\mathbf{R}_{\mathbf{B}} - \mathbf{V}_{\mathbf{B}\mathbf{E}} - \beta \mathbf{I}_{\mathbf{B}}\mathbf{R}_{\mathbf{E}} = \mathbf{0}$$

Solving for I_B:

$$\mathbf{I}_{\mathbf{B}} = \frac{\mathbf{V}_{\mathbf{C}\mathbf{C}} - \mathbf{V}_{\mathbf{B}\mathbf{E}}}{\mathbf{R}_{\mathbf{B}} + \beta(\mathbf{R}_{\mathbf{C}} + \mathbf{R}_{\mathbf{E}})} \qquad \mathbf{I}_{C} = \beta \mathbf{I}$$

Fundumental of Electronic I Msc: Munther Naif Thiyab

 V_{CC}

Collector-Emitter Loop

Applying Kirchoff's voltage law: I'_C $\mathbf{I}_{\mathbf{E}} \mathbf{R}_{\mathbf{E}} + \mathbf{V}_{\mathbf{C}\mathbf{E}} + \mathbf{I'}_{\mathbf{C}} \mathbf{R}_{\mathbf{C}} - \mathbf{V}_{\mathbf{C}\mathbf{C}} = \mathbf{0}$ Since $I'_C \cong I_C$ and $I_E \cong I_C$: I_C $I_{C}(R_{C} + R_{E}) + V_{CE} - V_{CC} = 0$ V_{CE} Solving for V_{CE}: $\mathbf{V}_{\mathbf{CE}} = \mathbf{V}_{\mathbf{CC}} - \mathbf{I}_{\mathbf{C}} (\mathbf{R}_{\mathbf{C}} + \mathbf{R}_{\mathbf{E}})$
